

Congratulations on your purchase of a GAMA Electronics Rechargeable Transmitter

The rechargeable transmitter can be used with GAMA Electronics RF Remote Control Systems.

The rechargeable transmitter features a long-life rechargeable battery. The life on a single battery charge is 12 times longer than the battery life on our standard transmitter. You can expect 9 hours of transmitting time on a single charge. We offer a waterproof pouch with a lanyard as an accessory for all of our transmitters (GAMA part number ZLB-67). The pouch is waterproof to IP67 (protected against temporary immersion in water). The rechargeable transmitters will fit into the pouch and can be operated while inside.

The transmitter will charge at different speeds depending on the outlet or charger it is connected to. Slower chargers can take 2-3 hours to fully charge low battery. The transmitter is housed in a water resistant enclosure. It has an internal gasket and features a water resistant USB connector that protects the control from dust, splashing water and rain.

Charge the transmitter by plugging a micro USB cable into the connector located here, on the bottom of the transmitter.

The transmitter can be charged using a micro USB cable and any standard USB outlet or charger. We have included a cable and a charger for your convenience.

When the transmitter is plugged into a USB outlet/charger the LED backlights will slowly fade on and then fade off while the unit is charging. Once the transmitter has reached a full charge, the LEDs will extinguish and remain off.
